

# Comparing the performance of image registration frameworks (Voxelmorph, SPAM, Airlab) on video of retinal

Anh Quang

January 10, 2024

# Agenda

- Introduction: Voxelmorph, SPAM, Airlab
  - Problem: does not work when directly apply on retina video
- Experiment 1: MNIST data
  - A. Moving images are affine transformations of fixed image (rigid)
  - B. Moving images are non-rigid transformation of fixed image
- Experiment 2: simpler image of retina vessel (Airlab only)
  - A. Moving images are affine transformations of fixed image
  - B. Add additional specific patterns to fixed image

# Evaluation

Evaluation by mean squared error over all pixels intensity between the fixed image (F) and the transformed of moving image (G')

$$MSE = \frac{1}{XY} \sum_{x=1}^X \sum_{y=1}^Y (F(x, y) - G'(x, y))^2$$

# Experiment 1: MNIST data

a. Moving images are affine transformations of fixed image (rigid)

Airlab

Translation  $x = -2$   
Translation  $y = -2$

Fixed image

Rotation angle =  
-20 degree

Moving image

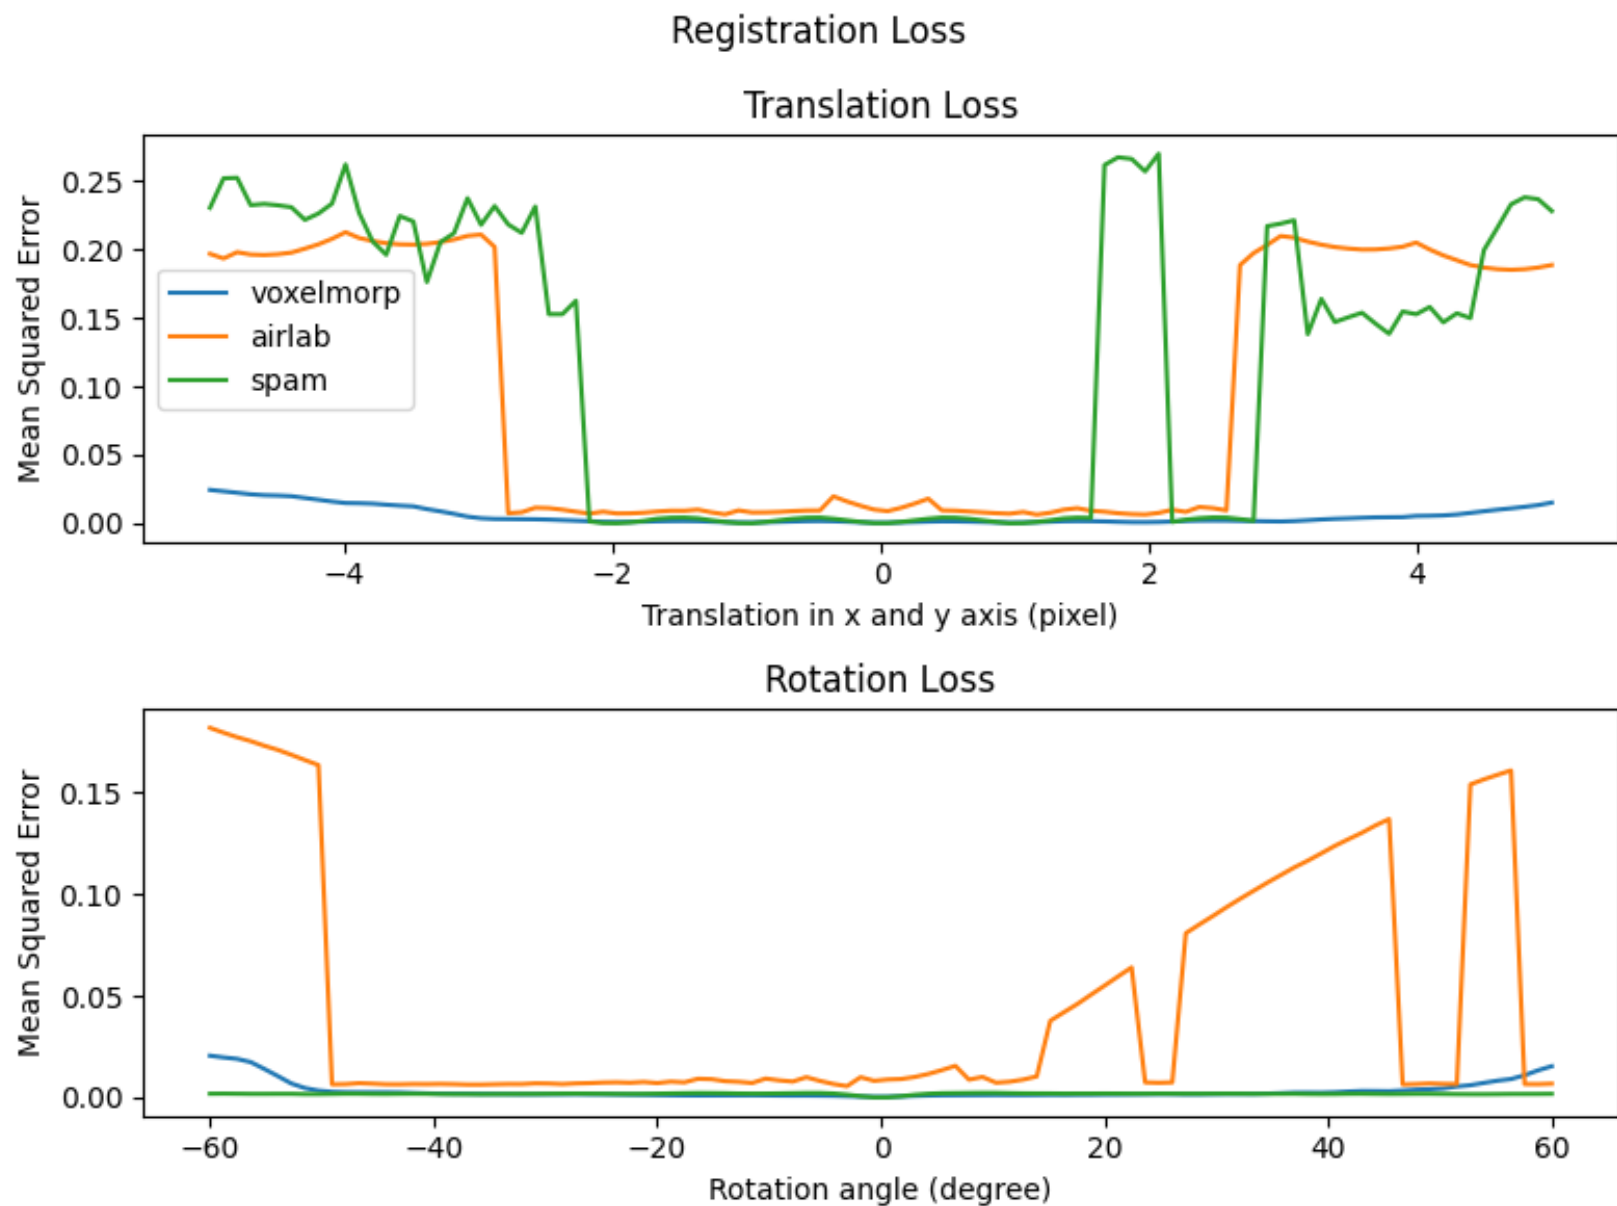

Overlay fixed and  
moving image

Transformed image

Overlay fixed and  
transformed image

# Comparison

$$t_x \in [-5, 5]$$
$$t_y \in [-5, 5]$$
$$\phi \in [-60, 60]$$

**b. Moving images are non-rigid transformation of fixed image**

Original MNIST data set number 5

	Airlab	SPAM	Voxelmorph
Loss (mean for 1000 pairs)	0.09	4909 (diverge)	0.002
Speed(frame/second)	0.128	37.43	14.83

## Experiment 2: simpler image of retina (Airlab only)

- Input: original fixed image

- $X_{trans} = 10$
- $Y_{trans} = 5$
- Rotation = 1 deg
- → well registered

- $X_{trans} = 10$
- $Y_{trans} = 5$
- Rotation = 2
- → does not work

- Overlay of fixed and moving image

- Overlay of fixed and transformed image

- Input: fixed image with rectangles
- $X_{trans} = 10$
- $Y_{trans} = 5$
- Rotation = 4 deg
- → well registered up to 4 deg rotation

- $X_{trans} = 10$
- $Y_{trans} = 5$
- Rotation = 5 deg
- → does not work

• Overlay of original images

• Overlay of fixed and transformed image

- Inputs are images with random lines
- $X_{trans} = 10$
- $Y_{trans} = 5$
- Rotation = 7 deg
- → well registered up to 4 deg rotation
- $X_{trans} = 10$
- $Y_{trans} = 5$
- Rotation = 8
- → does not work from 8 deg rotation
- Airlab applied on retinal images works even worst, increase the number of iteration does not help

- Overlay of original images
- Overlay of fixed and transformed image
